

Year: 5  
Term: Autumn 2  
Topic: Data and Information - Flat-file Databases

**Data** is raw numbers and figures. **Information** is what we can understand from analysing data. There are lots of different ways that we can collect, log and interpret data, including by using **databases**.

A **database** is a collection of organised data that is easily stored and used. Databases often structure data in logical ways (e.g. in columns, rows and tables) so that it can be accessed by those who need it easily. Databases are made up of individual records, which contain information in different fields (**categories**).

### Paper Databases

Paper databases require the creator to manually write in individual records, and to sort the records in an appropriate order. Paper records can still be useful in small databases, particularly where information is not changing and does not need to be amended frequently. However, most large databases are now stored on computers.

### Computer Databases

Many computer programs allow us to create databases, e.g. *j2data* or *Microsoft Excel*. Computer databases have become more popular than paper databases, as data can be easily and quickly added or removed, sorted, filtered, edited, or viewed at any time.

### Presenting data

Data can be shown visually, by using graphs and charts. This allows users to quickly and easily find answers to the questions that they need. It helps the user to easily see trends and to sequence information.

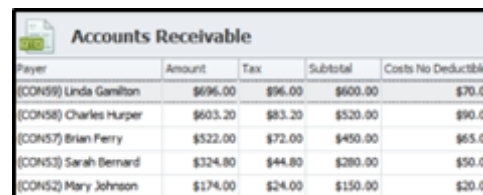

Charts and graphs can be created by selecting the charts icon and selecting which fields to display in the x-axis and y-axis.

### Using Databases

Remember that databases are used in order to quickly and easily find information. Databases are only able to do this if the data is organised logically into clear records and fields.

Databases are used in most place of work across the world. e.g. medical records, school student information, flight logs and business accounts.

Payer	Amount	Tax	Subtotal	Costs No Deductible
(CONS9) Linda Gamilton	\$696.00	\$96.00	\$600.00	\$70.00
(CONS8) Charles Hurper	\$603.20	\$83.20	\$520.00	\$90.00
(CONS7) Brian Ferry	\$522.00	\$72.00	\$450.00	\$65.00
(CONS3) Sarah Bernard	\$324.80	\$44.80	\$280.00	\$50.00
(CONS2) Mary Johnson	\$174.00	\$24.00	\$150.00	\$20.00

### Using a Computer Database

Computer databases often contain large amounts of data. We can find the data that we need by using the 'search', 'filter' and 'sort' functions.

**Search** functions allow us to type in the exact word/s that we are looking for. This can be useful if we are looking for a particular record.

If we are looking for records that share certain information we can **filter** out data by different fields. For example, we filter in the 'age' field for all students aged 23. The database will then present only the students aged 23.

We can also **sort** records by the data in particular fields. e.g. we may sort by the students' ages, from youngest to oldest. The youngest student will then appear at the top.
